Angular-app: Tree of components

Recap - Applications as a “tree of components”

- Multiple components?
 1. Create files manually – or let CLI handle this for you
 1. `ng generate component <component-name>`
 2. `Ng g c <component-name>`
 2. Import in module – or (again) let CLI take care of this for you
 3. Add to declarations : [...] section of `@NgModule`.
 4. Add the selector via HTML to parent-component
- Repeat for every component

1. Add DetailComponent

```
// city.detail.ts
import { Component } from '@angular/core';

@Component({
  selector: 'city-detail',
  template: `
    <h2>City details</h2>
    <ul class="list-group">
      <li class="list-group-item">Name: [city name]</li>
      <li class="list-group-item">Province: [province]</li>
      <li class="list-group-item">Highlights: [highlights]</li>
    </ul>
  `
})
export class CityDetail{}
```

2. Add to Module – or let CLI handle this

```
// Angular Modules  
...  
  
// Custom Components  
import {AppComponent} from './app.component';  
import {CityDetail} from './city.detail';  
import {CityService} from "./city.service";  
  
// Module declaration  
@NgModule({  
    imports      : [BrowserModule, HttpModule],  
    declarations: [AppComponent, CityDetail],  
    bootstrap    : [AppComponent],  
    providers    : [CityService]  
})  
export class AppModule {  
}
```

New component

Add to
declarations:[]

3. Encapsulate in HTML

```
<!-- app.html -->  
  
<div class="row">  
  
  ...  
  
  <div class="col-md-6">  
  
    ...  
  
    <city-detail></city-detail>  
  
  </div>  
  
</div>
```

Combine with other HTML

4. Result

Cities via een service

Mijn favoriete steden zijn :

1 - Groningen

2 - Hengelo

3 - Den Haag

4 - Enschede

5 - Heerlen

6 - Mechelen

City details

Naam: [naam van stad]

Provincie: [provincie]

Highlights: [highlights]

To be filled in...

Goal: show details of selected city in child-component

Data flow between components

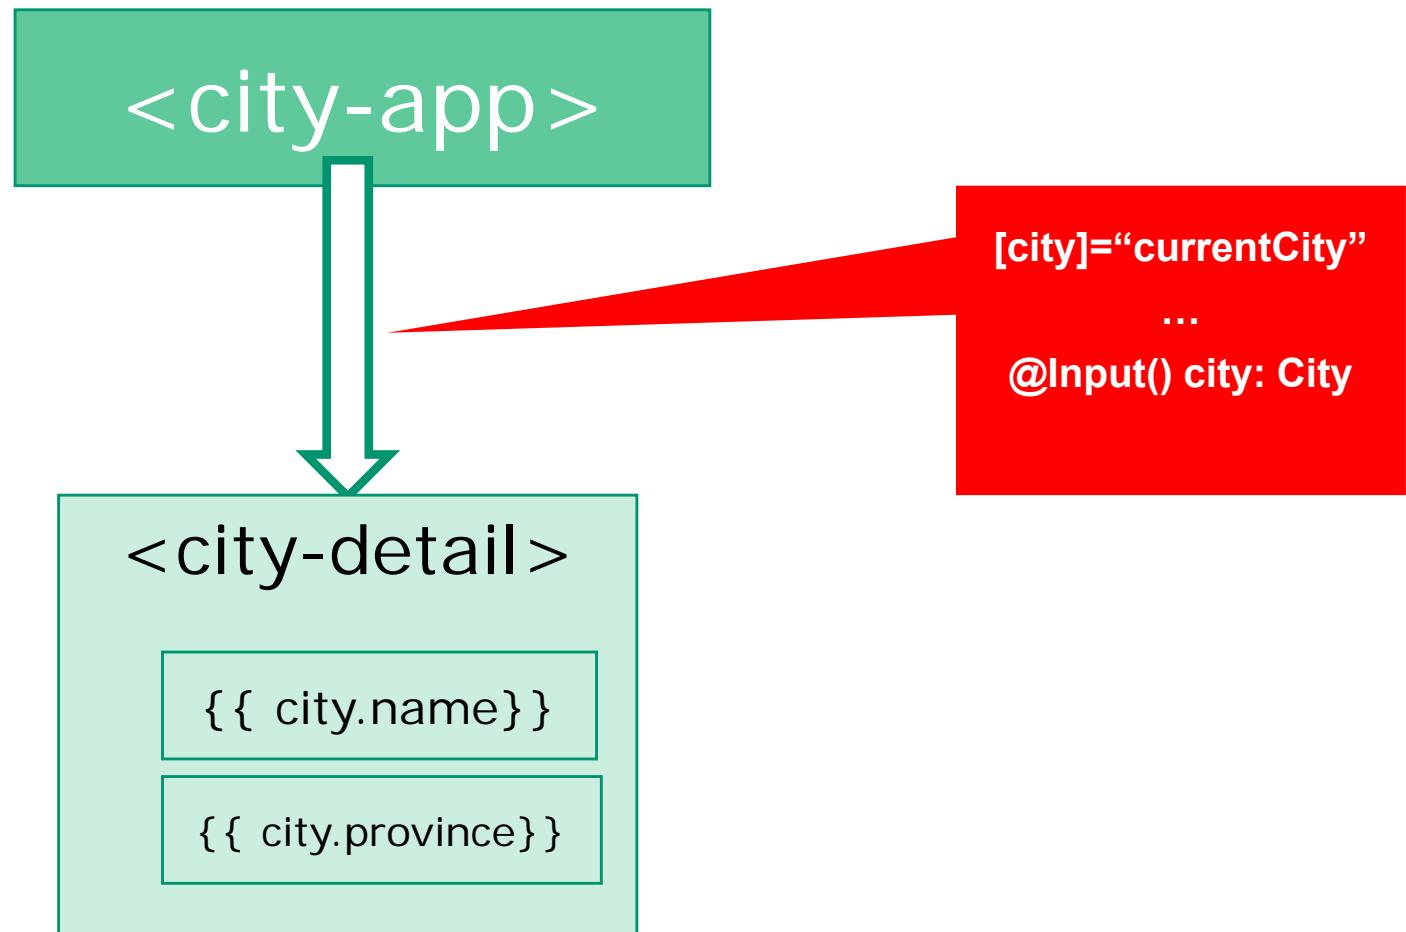

Using inputs and outputs

Data flow between components

*“Data flows in to a component
via @Input()’s ”*

*Data flows out of a component
via @Output()’s ”*

Parent-Child flow: decorator @Input()

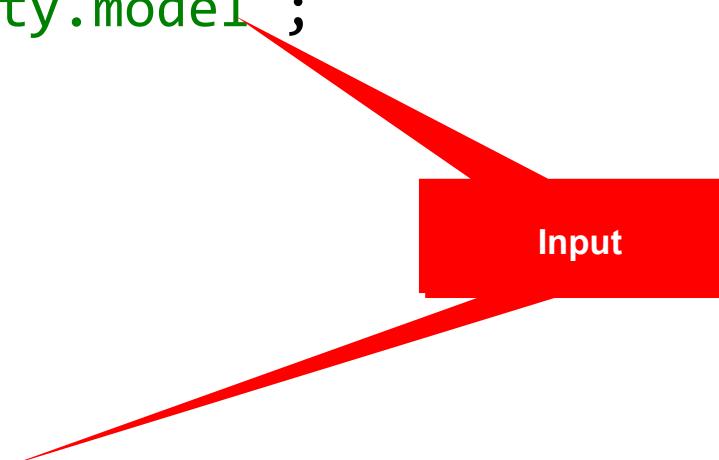

Working with @Input()

1. Import Input decorator in component
2. Use annotation @Input() in class definition

```
// city.detail.ts
import { Component, Input } from '@angular/core';
import { City } from "./city.model";

@Component({
  ...
})

export class CityDetail {
  @Input() city: City;
}
```

A red arrow originates from the `@Input()` annotation in the code snippet and points towards a red rectangular box. Inside this box, the word "Input" is written in white.

Update Parent Component for @Input

```
<!-- app.html -->
<div class="row">
  <div class="col-md-6">
    ...
    <ul class="list-group">
      <li *ngFor="let city of cities" class="list-group-item"
          (click)="getCity(city)">
        {{ city.id }} - {{ city.name }}
      </li>
    </ul>
    <button *ngIf="currentCity" class="btn btn-primary"
           (click)="clearCity()">Clear</button>
  </div>
  <div class="col-md-6">
    <div *ngIf="currentCity">
      <city-detail [city]="currentCity"></city-detail>
    </div>
  </div>
</div>
```

Update!

Result

Cities via een service

Mijn favoriete steden zijn :

1 - Groningen

2 - Hengelo

3 - Den Haag

4 - Enschede

5 - Heerlen

6 - Mechelen

Clear

City details

Naam: Enschede

Provincie: Grote Markt

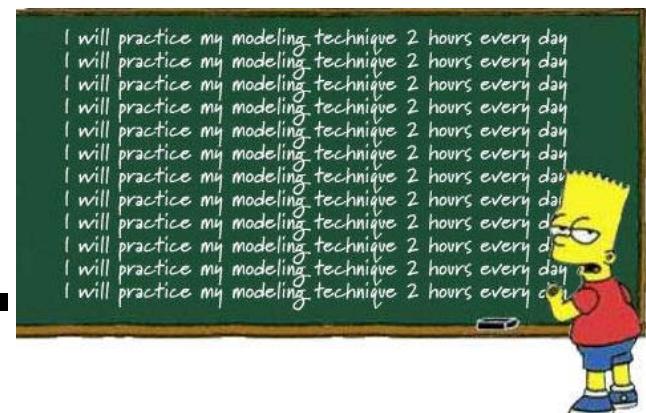

Highlights: Twentse Welle museum

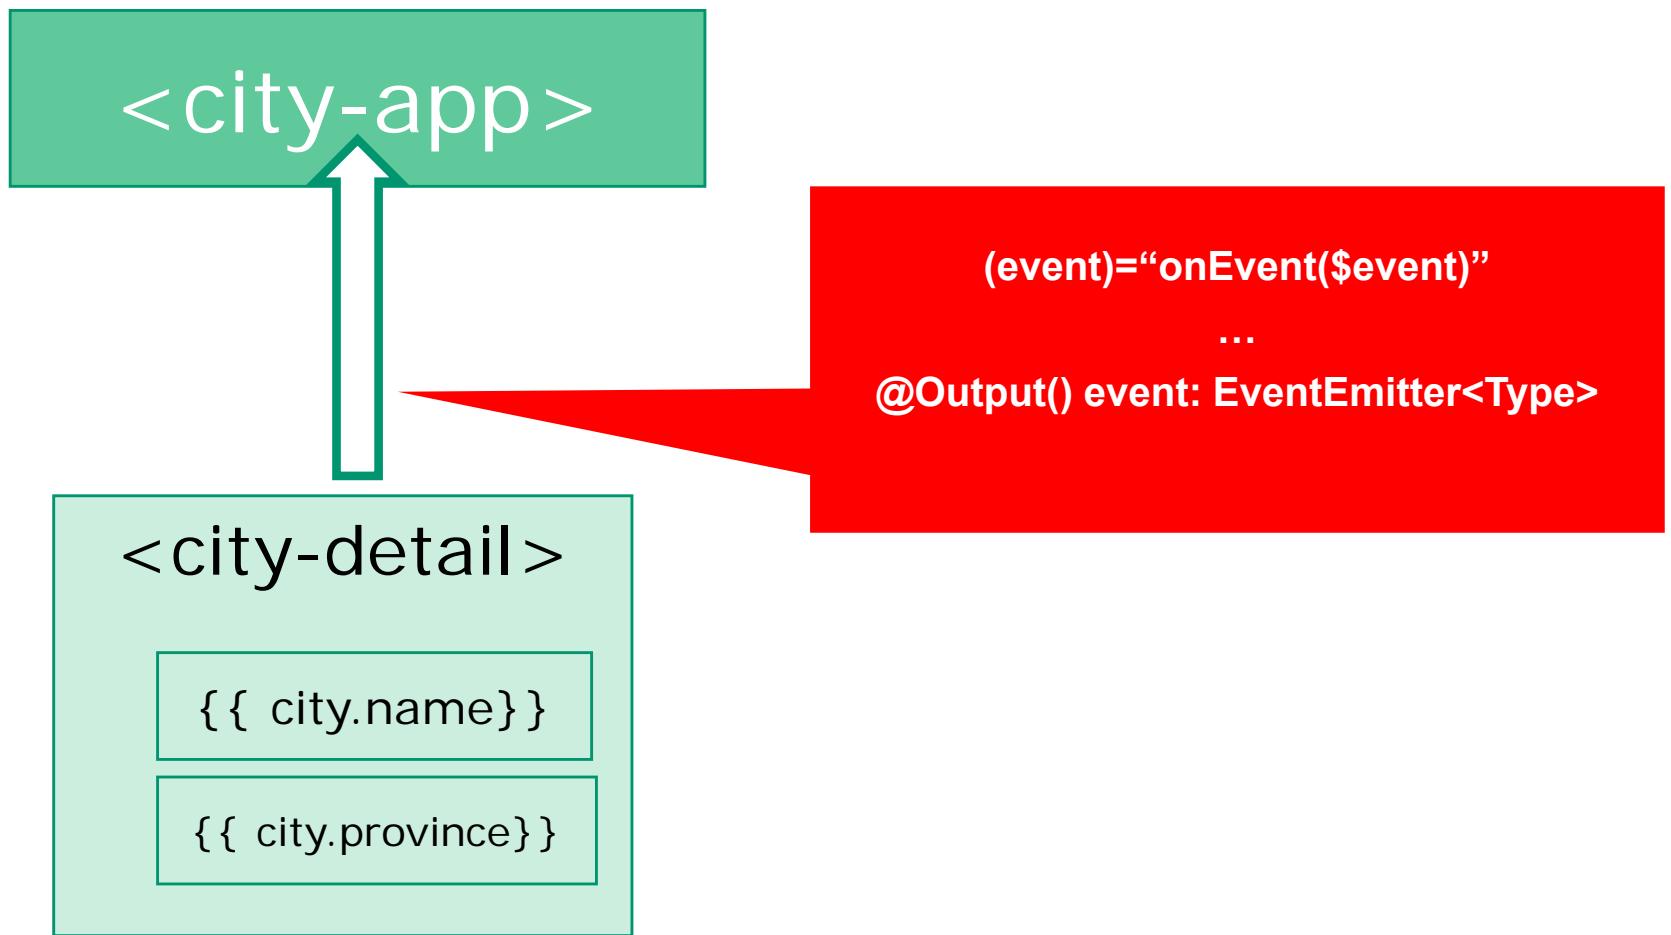

Checkpoint

- Components can be placed inside other components
- Enhance the HTML of the Parent Component with selector of the Child Component
- Remember to import the Child Component in @NgModule
- Data flow to Child Component : use `@Input()` and `[propName] = "data"`
- Exercise: 6a) and 6b)
- Example: /300-components

Exercise....

Child-Parent flow: decorator @Output()

Method – equally, but the other way around

1. Import Output in component
2. Use decorator @Output() in class definition
3. New: define EventEmitter to emit events of certain type

*“With @Output,
data flows up the Component Chain”*

Rating our cities

```
// city.detail.ts
import { Component, Input, Output, EventEmitter} from '@angular/core';

@Component({
  ...
  template: `
    <h2>City details
      <button (click)="rate(1)"+1</button>
      <button (click)="rate(-1)">-1</button>
    </h2>
    ...
  `
})
export class CityDetail {
  @Input() city:City;
  @Output() rating: EventEmitter<number> = new EventEmitter<number>();

  rate(num) {
    console.log('rating for ', this.city.name, ': ', num);
    this.rating.emit(num);
  }
}
```

Imports

Bind custom events to DOM

Define & handle custom @Output event

Prepare parent component for custom event

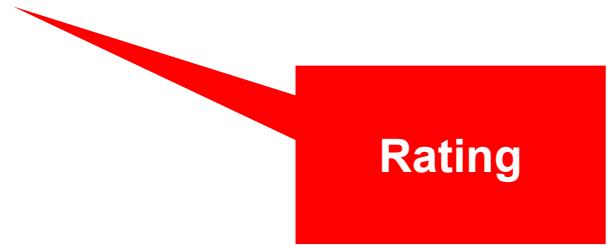

```
<!-- app.html -->  
  
<div *ngIf="currentCity">  
  <city-detail [city]="currentCity" (rating)="updateRating($event)">  
  </city-detail>  
</div>
```

Capture custom
event

```
// app.component.ts  
// increase or decrease rating on Event Emitted  
updateRating(rating){  
  this.currentCity.rating += rating;  
}
```

Show rating in HTML

```
<li *ngFor="let city of cities"
    class="list-group-item" (click)="getCity(city)">
    {{ city.id }} - {{ city.name }} ({{i}})
    <span class="badge">{{city.rating}}</span>
</li>
```

Rating

Result

Cities via een service

Mijn favoriete steden zijn :

1 - Groningen	0
2 - Hengelo	0
3 - Den Haag	3
4 - Enschede	0
5 - Heerlen	2
6 - Mechelen	5

Clear

City details

+1

-1

Naam: Den Haag

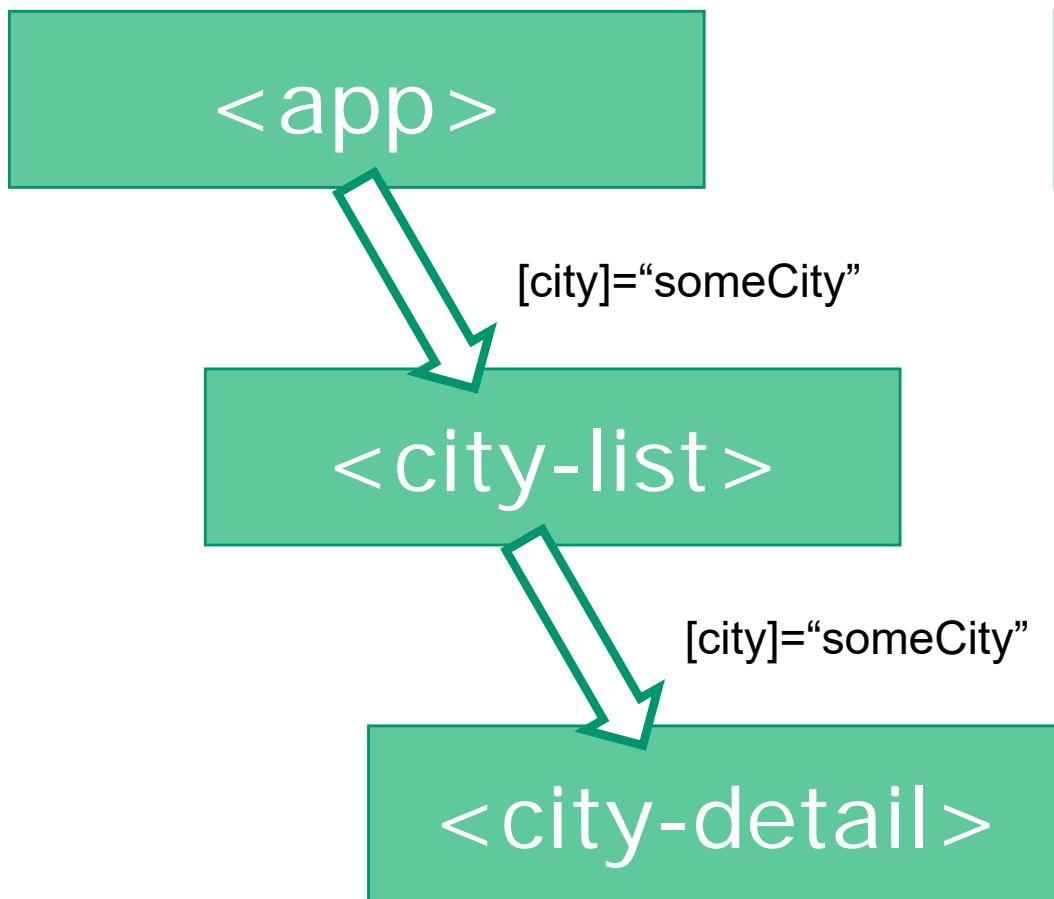

Provincie: Zuid-Holland

Highlights: Binnenhof

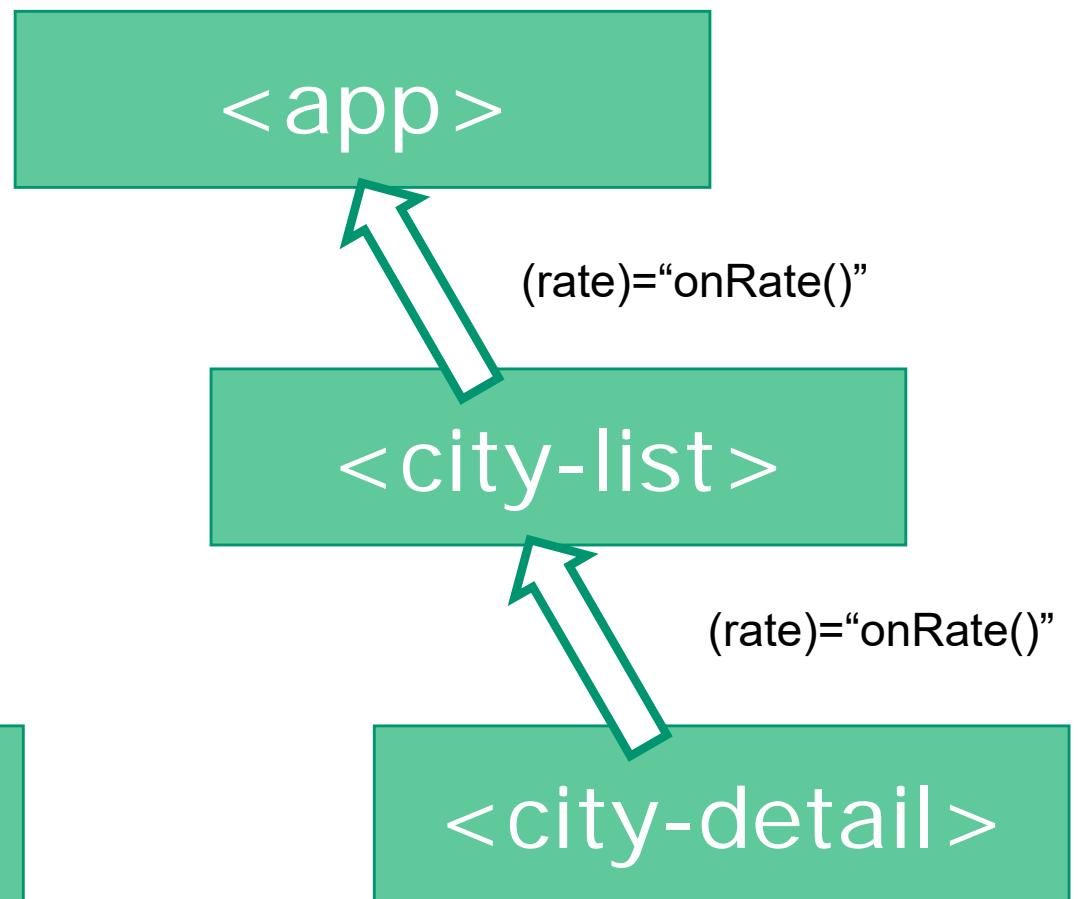

Summary

Parent → Child

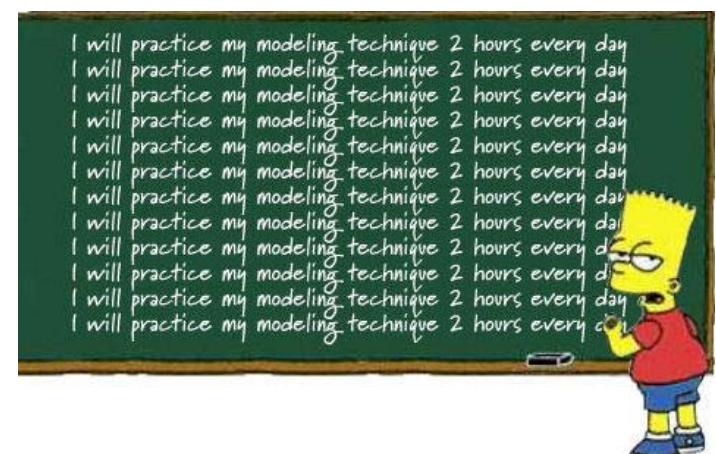

Child → Parent

Checkpoint

- Data flow to Parent Component : using `@Output()` and
`(eventName) = "eventHandler($event)"`
- You can throw *any type* of data with the `EventEmitter`.
- Exercise: 6c)
- Example: /302-components-output
- More info: <https://vsavkin.com/the-core-concepts-of-angular-2-c3d6cbe04d04>

Exercise....

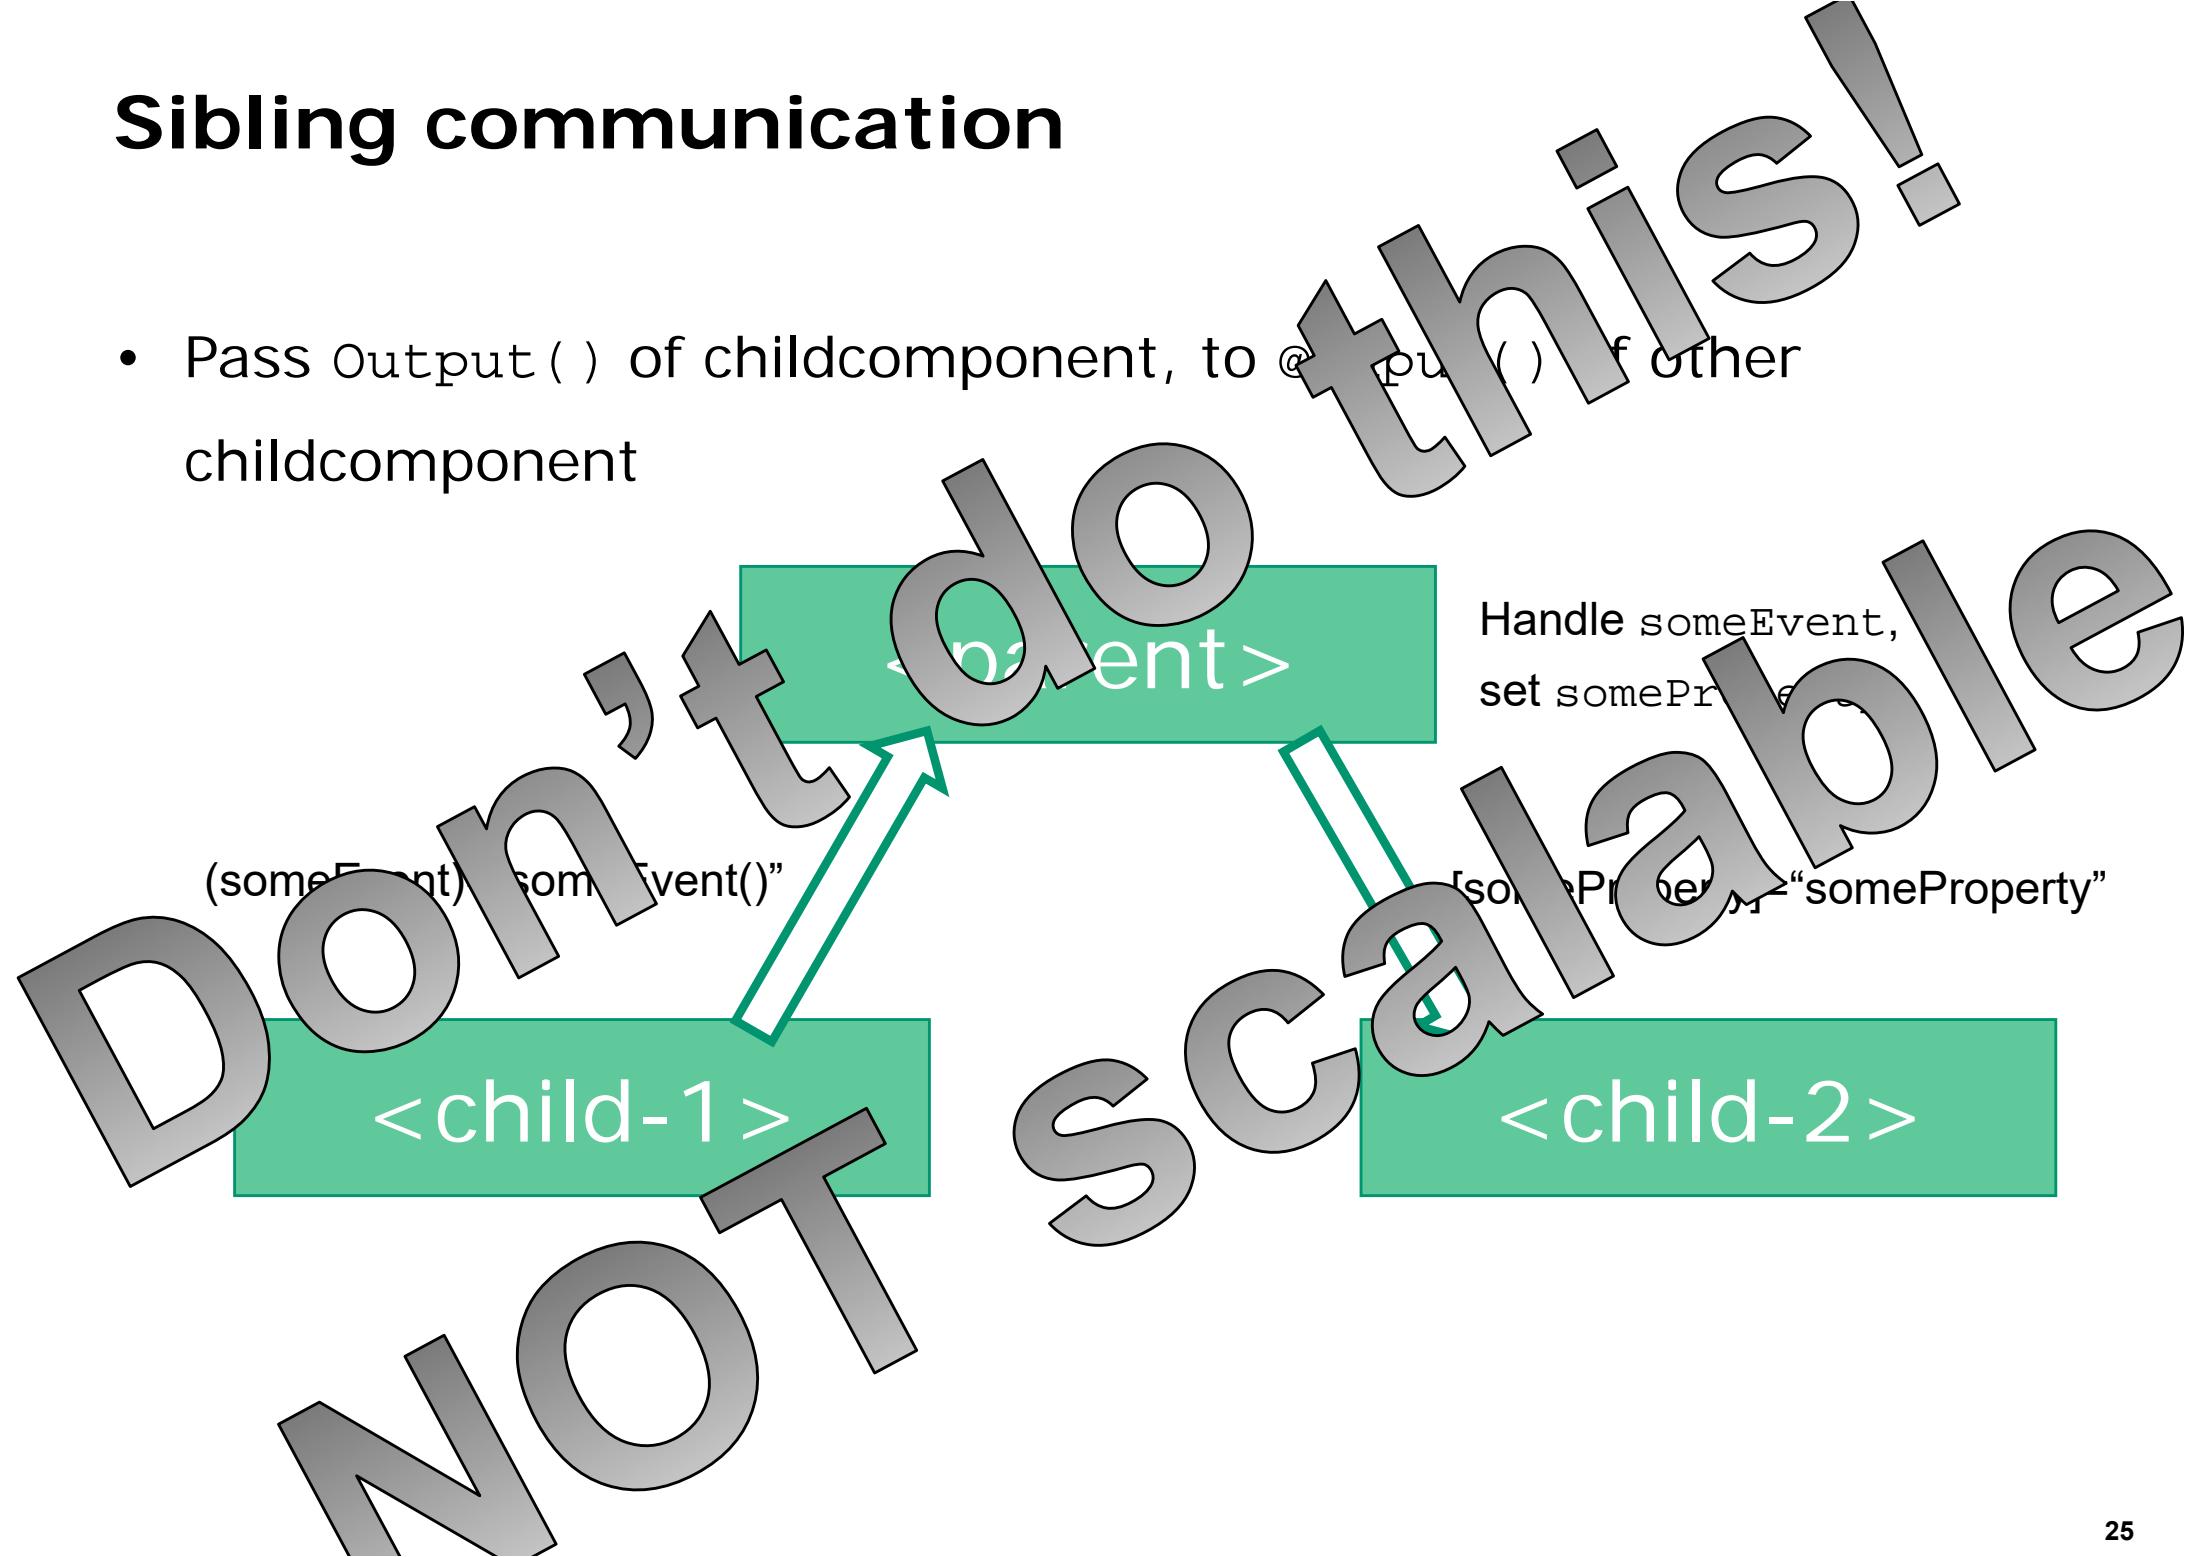

Sibling communication

Sibling communication

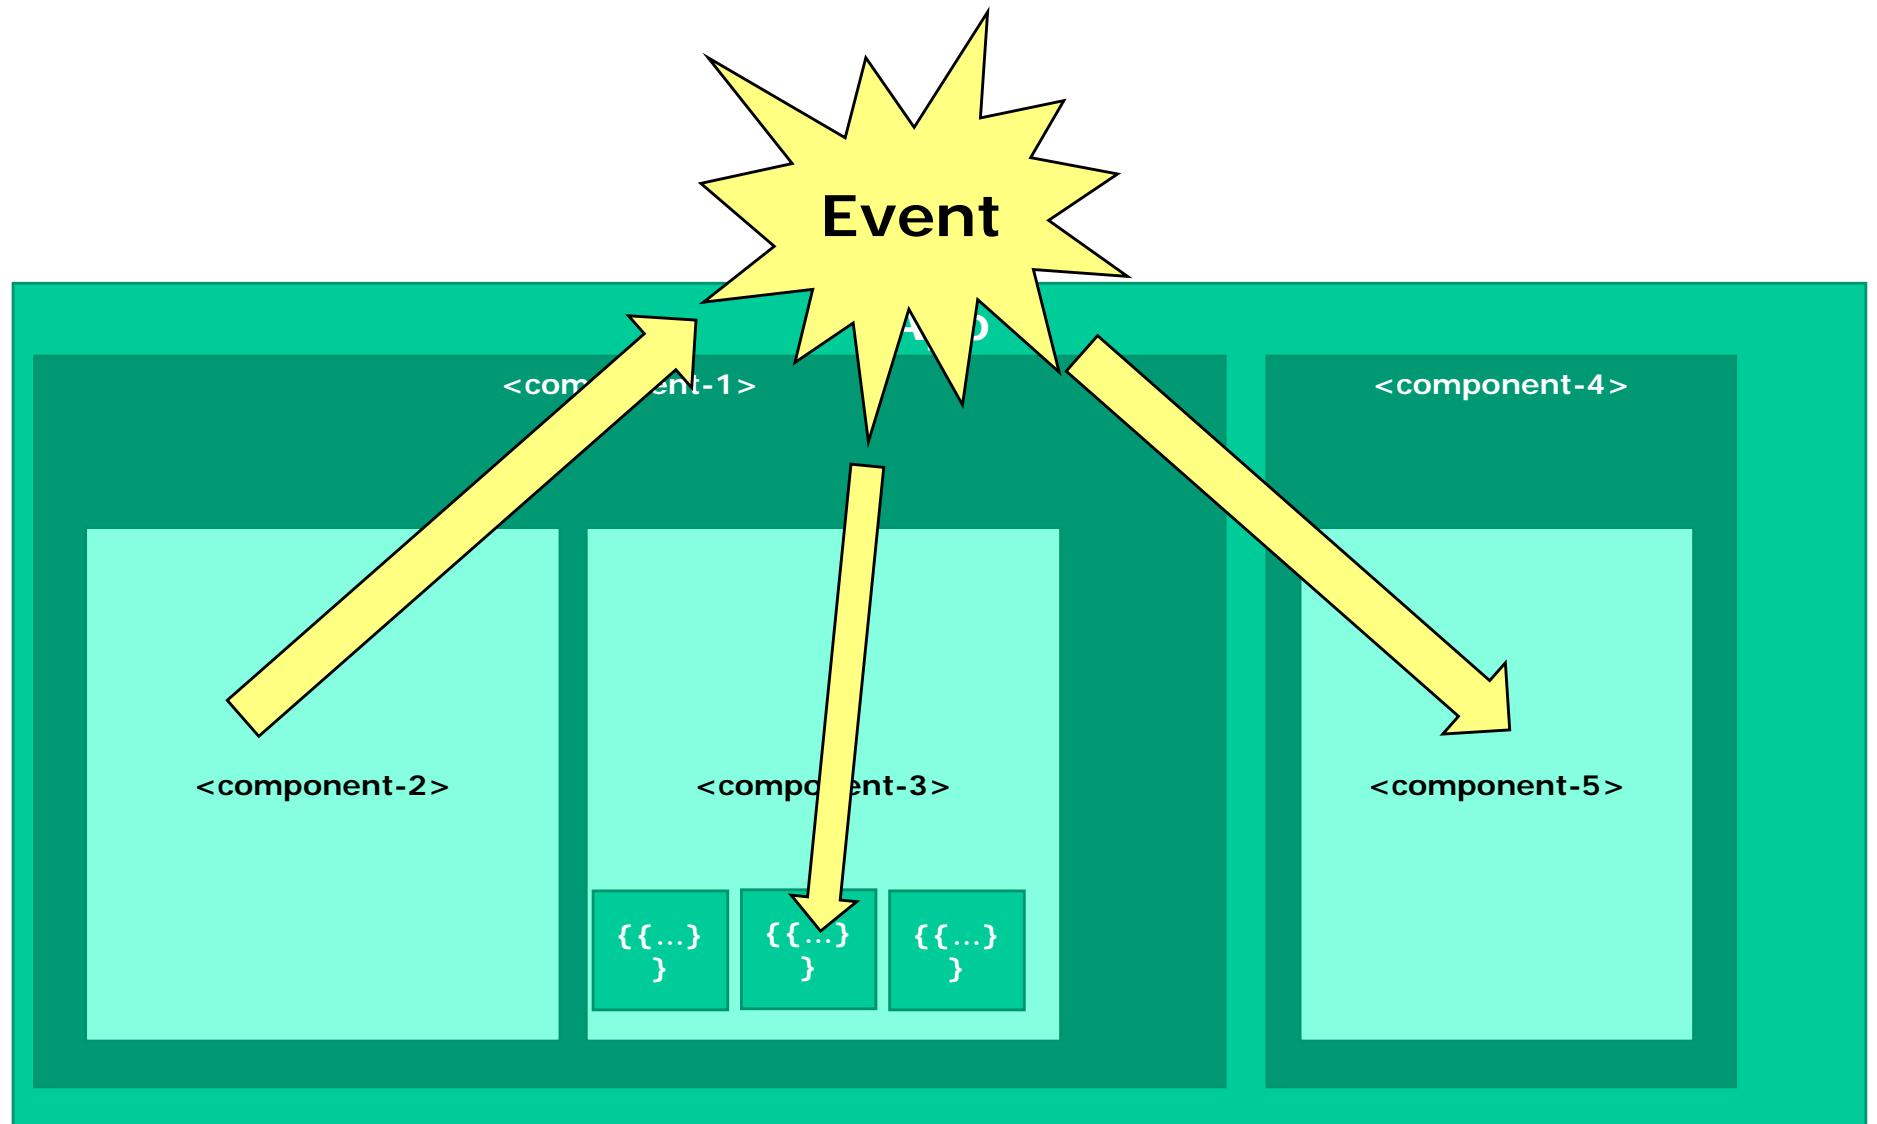

- Pass Output() of childcomponent, to @Input() of other childcomponent

Better solution – using a Pub/Sub-system with Observables

- <http://www.syntaxsuccess.com/viewarticle/pub-sub-in-angular-2.0>

*“Custom events,
write an event bus”*

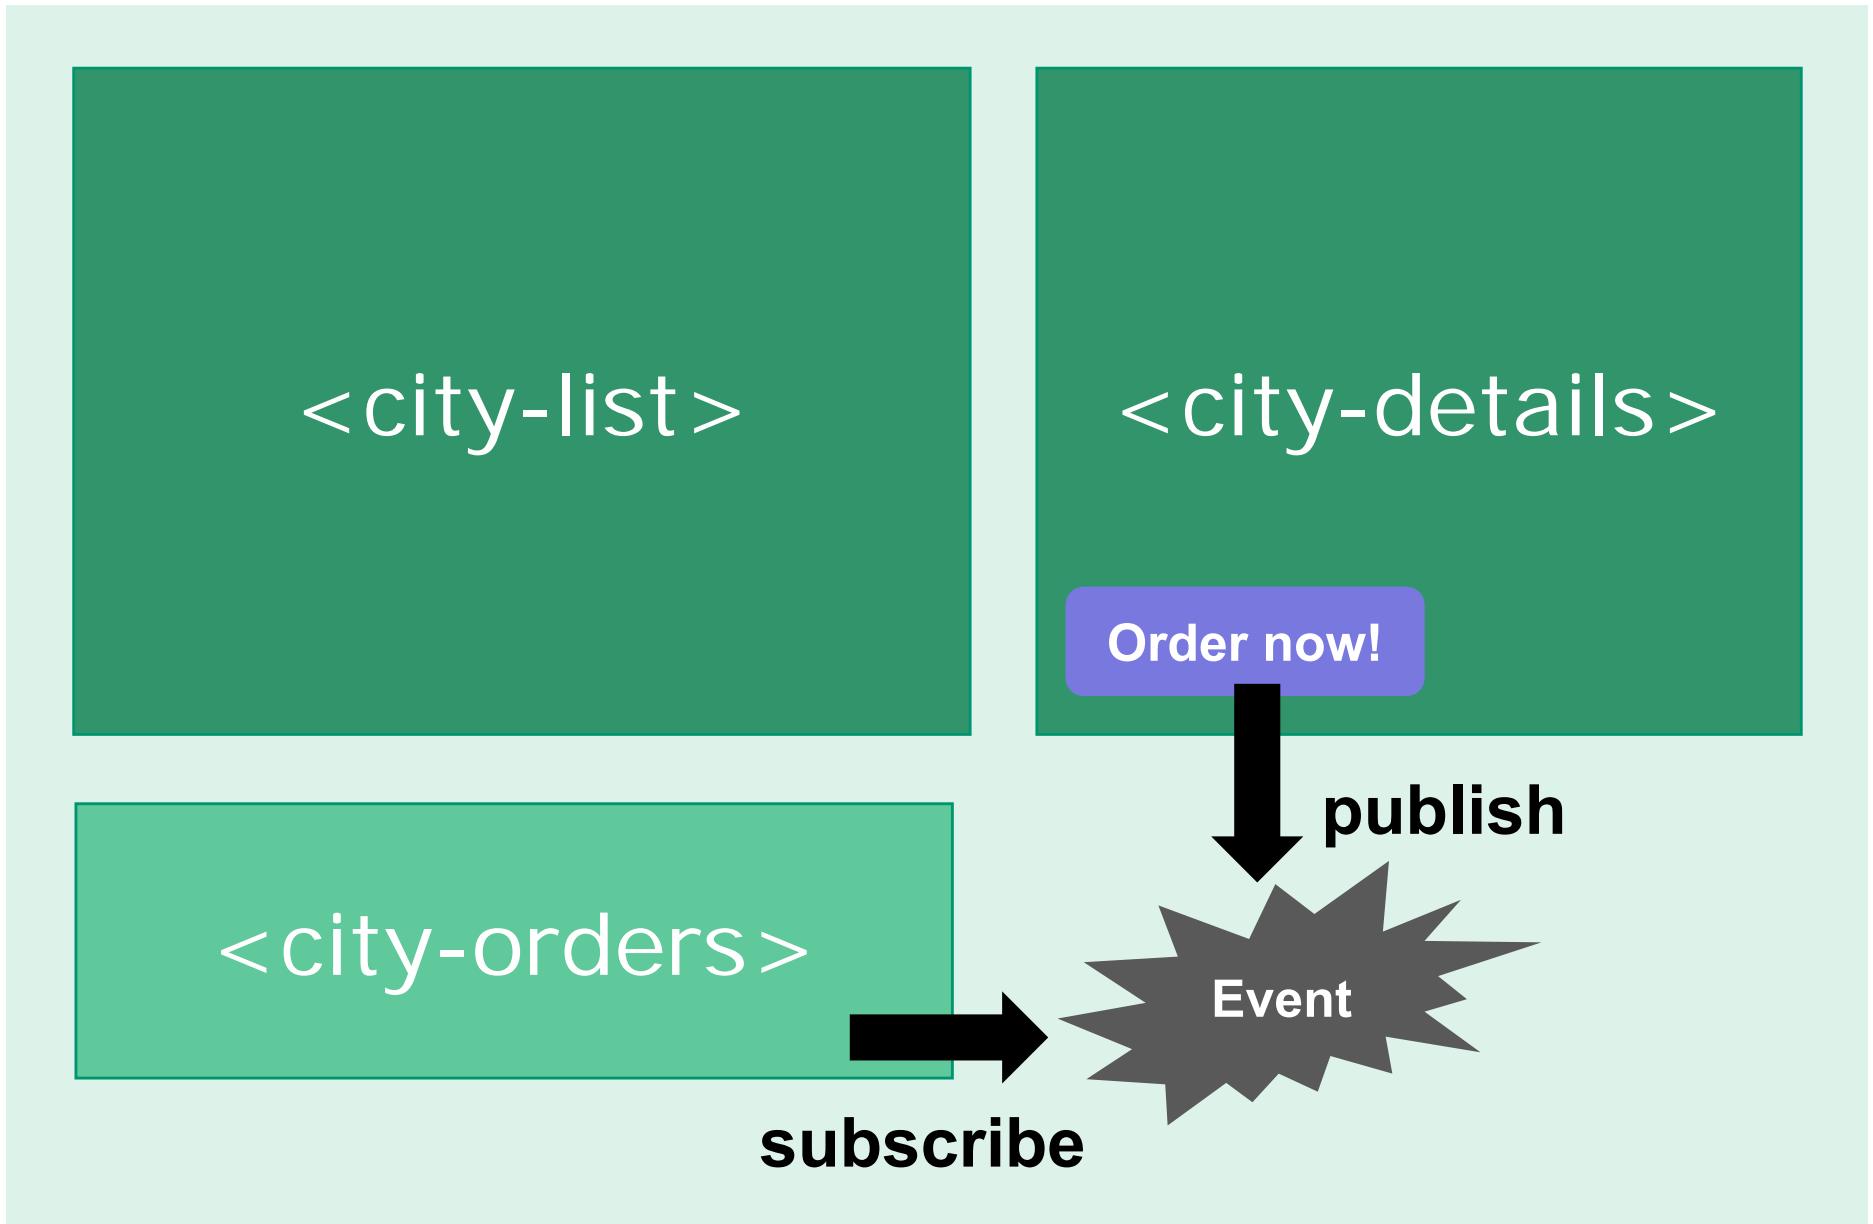

Options

From RxJS library, work with

- EventEmitter()
- Observable()
- Observer()
- Subject() (implements Observable and Observer)

“Publish en Subscribe” – PubSub system

Create PubSub-service

- Step 1 – create Publication Service
- Step 2 – Create ‘Producer’, or ‘Publish’ – component
- Step 3 – Create Subscriber-component

1. OrderService

```
// order.service.ts

import {Subject} from "rxjs/Subject";
import {Injectable} from "@angular/core";
import {City} from "../model/city.model";

@Injectable()
export class OrderService {

    Stream:Subject<City>;

    constructor() {
        this.Stream = new Subject<City>();
    }
}
```

2. Producer component ('Order now' button)

HTML:

```
<h2>Price of city trip:  
{{ city.price | currency:'EUR':true:'1.2' }}  
<button class="btn btn-lg btn-info"  
       (click)="order(city)">Order Now!</button>  
</h2>
```

Class:

```
// Place order. Emit event for this city.  
  
// Catch the event in city.orders.ts  
  
order(city) {  
  
  console.log(`City trip booked for: ${this.city.name}`);  
  
  this.orderService.Stream.next(city);  
  
}
```

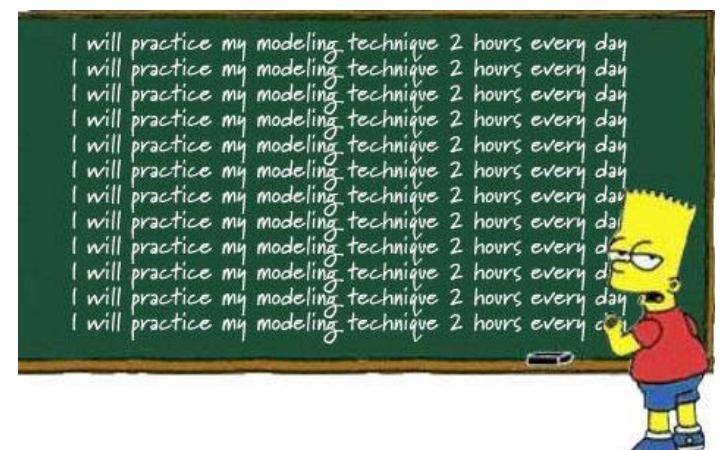

3. Subscriber component

```
// city.orders.ts - a kind of simple shopping cart,  
// register which city trips are booked.  
import ...  
  
@Component({  
  selector: 'city-orders',  
  template: `  
    <div *ngIf="currentOrders.length > 0">  
      ...  
    </div>  
  `})  
  
export class CityOrders {  
  ...  
  ngOnInit() {  
    this.orderService.Stream  
      .subscribe(  
        (city:City) => this.processOrder(city),  
        (err)=>console.log('Error handling City-order'),  
        ()=>console.log('Complete...')  
      )  
    }  
    ...  
  }  
}
```

Checkpoint

- Event Bus : work with 'invisible' Streams and Subject
- There are options on working with Observable Streams.
- (Optional/Advanced: use a Redux-store (for example @ngrx/store))
- Example: /303-pubsub-ordercomponent
- Exercise : 6d) e-commerce application

Exercise....

More on observables

The image shows a screenshot of a blog post from Thoughtram. At the top, there's a navigation bar with a brain icon and the word "THOUGHTRAM" on the left, and "TRAINING", "CODE REVIEW", and "BLOG" on the right. Below the navigation bar is a horizontal timeline represented by a black arrow pointing to the right, with four circular nodes numbered 1, 2, 2, and 3. The first node (1) is blue, the second (2) is dark brown, the third (2) is dark brown, and the fourth (3) is green. The main title of the post is "TAKING ADVANTAGE OF OBSERVABLES IN Angular 2", with the subtitle "distinctUntilChanged()" visible below it. Below the title, the author information "by Christoph Burgdorf on Jan 6, 2016 (updated on May 12, 2016)" and the reading time "12 minute read" are displayed. A small note at the bottom of the page says "Some people seem to be confused why Angular 2 seems to favor the Observable abstraction".

Angular 2 Observable Data Services

Nov 17, 2015

Updated May 6, 2016 - 8 min read

Angular 2 brings many new concepts that can improve our JavaScript applications. The first new concept to Angular is the use of Observables. Observables are a proposed feature for ES2016 (ES7). I wont go in depth into Observables but will just cover some of the high level concepts. If you want an introduction to Observables check out my screen cast.

INTRO TO RXJS OBSERVABLES AND ANGULAR 2

The rest of this post will cover more data and application state management in an Angular 2 application. At the time of this writing Angular is on version [Beta 1](#). This post has been updated as of [Beta 15](#). The syntax of how Observables and their

Observables In Angular 2.0

Author: [Torgeir Helgevold](#)

Published: Wed Jan 06 2016

Viewed 3375 times

The RxJs community has presented the idea that any series of events can be modeled as one or many asynchronous or synchronous arrays. In the following post I want to explore this by modeling a series of different user inputs as Observables.

I am still learning about Observables and their potential, but I figured it would be interesting to implement a custom text editor, from scratch, using Observables to represent keyboard and mouse events.

Building a perfect text editor is not really the point here, but I want to see if there is any added value from looking at input sequences as Observables. The first step when building a text editor is identifying which input events to support. In my sample I have decided to focus on adding the ability to input and delete characters. Currently I have limited the input
